

ExperimentNo.1.6

Student Name: Gaurav Kumar

Branch: MCA–CCD

Semester: III

Subject Name: DevOps Process Automation Lab

UID: 22MCC20177

Section/Group: MCD-1/A

Date of Performance: 8th Oct 23

Subject Code: 22CAP-745

1. Aim/Overview of the practical:

- Write a Scripted Pipeline to execute the build pipeline with all the 9 goals of Maven.
- Execute the Scripted Pipeline via Scripted Pipeline with SCM. Name the file as Jenkinsfile and build a pipeline.

2. Steps for practical: (a)

Step 1 : Create a new file in the root directory of your project. Name the file as Jenkinsfile and add the pipeline script for 9 maven goals.

```
1 pipeline {
2   agent any
3   tools {
4     maven 'maven1'
5   }
6   stages {
7     stage('fetch') {
8       steps {
9         echo 'Fetching the Maven Project from github'
10        git branch: 'main',
11        url: 'https://github.com/Gauravkumar1502/DevOpsPractical'
12      }
13    }
14    stage('validate') {
15      steps {
16        echo 'Validating the Maven Project'
17        sh 'mvn validate'
18      }
19    }
20    stage('clean') {
21      steps {
22        echo 'Cleaning the Maven Project'
23        sh 'mvn clean'
24      }
25    }
26  }
```

```
26     stage('compile') {
27         steps {
28             echo 'Compiling the Maven Project'
29             sh 'mvn compile'
30         }
31     }
32     stage('test') {
33         steps {
34             echo 'Testing the Maven Project'
35             sh 'mvn test'
36         }
37     }
38     stage('package') {
39         steps {
40             echo 'Packaging the Maven Project'
41             sh 'mvn package'
42         }
43     }
44     stage('verify') {
45         steps {
46             echo 'Verifying the Maven Project'
47             sh 'mvn verify'
48         }
49     }
50     stage('install') {
51         steps {
52             echo 'Installing the Maven Project'
53             sh 'mvn install'
54         }
55     }
56     stage('executing generate jar') {
57         steps {
58             echo 'Executing the generate jar file'
59             sh 'java -jar ./target/Sum.jar 10 25 30 55 67 89'
60         }
61     }
62 }
63 }
```

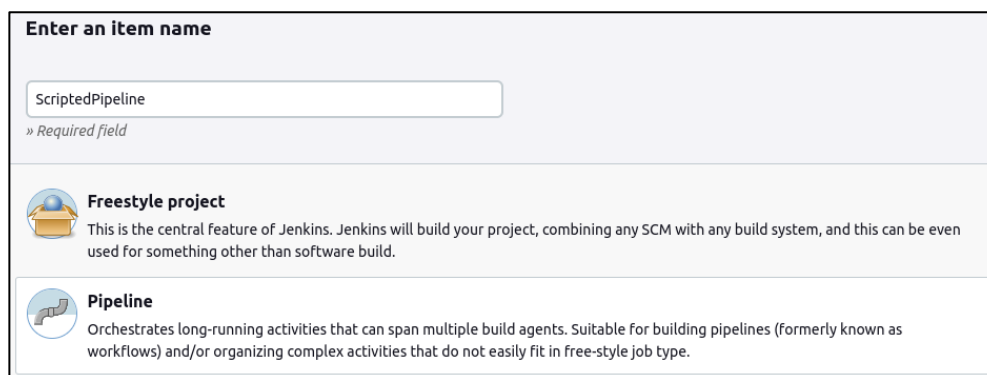

Steps for practical: (b)

Step 1 : To create a scripted pipeline via Jenkins SCM. First create a new pipeline by clicking on “+” icons on the Jenkins dashboard.

Step 2 : A new window will appear select **pipeline** option from menu and give a name to your pipeline and then click on OK.

Enter an item name

» Required field

**Freestyle project**
This is the central feature of Jenkins. Jenkins will build your project, combining any SCM with any build system, and this can be even used for something other than software build.

**Pipeline**
Orchestrates long-running activities that can span multiple build agents. Suitable for building pipelines (formerly known as workflows) and/or organizing complex activities that do not easily fit in free-style job type.

Step 3 : A new window will appear from which you can configure the create pipeline by providing scripts and selecting options.

- Step 4 :** Go to the Pipeline Section and select Pipeline script from SCM from the drop-down menu for the **pipeline Definition**.
- Step 5 :** For SCM option select Git and provide repository URL and branch name.
- Step 6 :** After all that give the Jenkins file name that is present inside your project (case sensitive) under **Script Path** and click **Save**.

Pipeline

Definition

Pipeline script from SCM

SCM ?

Git

Repositories ?

Repository URL ?

https://github.com/Gauravkumar1502/DevOpsPractical

Credentials ?

- none -
